$$\frac{v^2}{2g} + z + \frac{p}{\rho g} = \text{constant}$$

Where:

- v = flow velocity

This equation underpins the design of pipelines, open channels, and hydraulic structures, guiding engineers in predicting flow velocities, pressures, and energy losses.

Hydrological Cycle and Water Balance

Hydrology is grounded in the understanding of the hydrological cycle, which involves processes like evaporation, condensation, precipitation, infiltration, and runoff. Quantifying these components allows engineers to model water availability and distribution in basins.

Water Balance Equation:

\[

$$\text{Precipitation} = \text{Evaporation} + \text{Runoff} + \text{Infiltration} + \text{Change in Storage}$$

\]

Accurate water balance models are crucial for sustainable water resource management and designing infrastructure resilient to climate variability.
