- m is the mass of the object (in kilograms),
- a is the acceleration produced (in meters per second squared).

This law explains how the velocity of an object changes when subjected to an external force.

Question 2: Explain the phenomenon of refraction of light with an example.

Approach:

- Define refraction.
- Describe how light bends when passing from one medium to another.
- Provide an everyday example, such as a straw in water appearing bent.

Sample Answer:

Refraction of light is the bending of light rays when they pass from one transparent medium to another with a different optical density. This bending occurs because the speed of light changes in different media.

Example: When a straw is placed in a glass of water, it appears bent at the surface of the water. This is because light rays from the submerged part of the straw bend as they pass from water (denser medium) to air (rarer medium), making the submerged part look displaced.
