Understanding Machine Computational Thinking

What Is Computational Thinking?

Computational thinking (CT) is a problem-solving process that involves a set of skills and mental models derived from computer science. It enables humans to formulate problems and solutions in ways that can be directly translated into algorithms and programs. The core facets of CT include decomposition, pattern recognition, abstraction, and algorithm design.

For example, when you plan a trip, you break down the journey into steps (decomposition), notice similar routes or transportation modes (pattern recognition), simplify the choices by focusing on key factors (abstraction), and then create a step-by-step plan (algorithm). Similarly, in programming or machine instruction design, these mental models underpin how instructions are structured and executed.
