TIME VALUE OF MONEY PRACTICE PROBLEMS

Time Value of Money Practice Problems: Mastering the Concept for Financial Success

Understanding the time value of money practice problems is crucial for anyone looking to strengthen their financial literacy and make smarter investment decisions. The concept of the time value of money (TVM) revolves around the idea that a dollar today is worth more than a dollar in the future due to its potential earning capacity. This fundamental principle underpins various financial calculations, including loan payments, investment growth, and retirement planning. Engaging with practice problems is an effective way to grasp these calculations and develop confidence in applying TVM concepts to real-world scenarios.

What Is the Time Value of Money?

Before diving into practice problems, it's essential to understand the core idea behind the time value of money.

Definition and Importance

The time value of money suggests that money has a different value depending on when it is received or paid. This is because money can be invested to earn interest or returns over time. Therefore, a sum of money today is worth more than the same sum in the future.

Key Components of TVM

- **Present Value (PV):** The current worth of a future sum of money or stream of cash flows given a specified rate of return.
- **Future Value (FV):** The value of an investment after earning interest over a period.
- **Interest Rate (i):** The rate at which money grows over time, typically expressed annually.
- **Number of Periods (n):** The total number of compounding periods.

Common Types of Time Value of Money Practice Problems

Practicing different types of problems helps you understand how to apply the TVM formulas effectively.

1. Present Value of a Future Sum

This problem involves calculating how much a future sum is worth today, given a certain interest rate

and time period.

2. Future Value of a Present Sum

Here, the goal is to determine how much an initial investment will grow over time with compound interest.

3. Annuities and Perpetuities

These involve regular payments over time, such as loan repayments or savings plans.

4. Loan Amortization

Calculating periodic loan payments based on principal, interest rate, and loan term.

Sample Practice Problems and Step-by-Step Solutions

To solidify your understanding, let's work through some sample problems.

Problem 1: Calculating Present Value

Question:

What is the present value of receiving \$10,000 in 5 years if the annual discount rate is 6%?

Solution:

Using the Present Value formula:

$$PV = FV / (1 + i)^n$$

Where:

$$FV = \$10,000$$

$$i = 6\% = 0.06$$

$$n = 5$$

$$PV = 10,000 / (1 + 0.06)^5 = 10,000 / (1.3382256) \approx \$7,472.58$$

Answer:

The present value of \\$10,000 received in 5 years at a 6% discount rate is approximately \$7,472.58.

Problem 2: Calculating Future Value

Question:

If you invest \$5,000 today at an annual interest rate of 8%, what will be the value after 10 years?

Solution:

Using the Future Value formula:

$$FV = PV \times (1 + i)^n$$

Where:

$$PV = \$5,000$$

$$i = 8\% = 0.08$$

$$n = 10$$

$$FV = 5,000 \times (1 + 0.08)^{10} = 5,000 \times 2.158924997 \approx \$10,794.62$$

Answer:

Your \$5,000 investment will grow to approximately \$10,794.62 in 10 years.

Problem 3: Present Value of an Annuity

Question:

You plan to save \$2,000 annually for 15 years in an account earning 5% interest. What is the present value of these savings?

Solution:

Use the Present Value of an Ordinary Annuity formula:

$$PV = P \times [(1 - (1 + i)^{-n}) / i]$$

Where:

$$P = \$2,000$$

$$i = 5\% = 0.05$$

$$n = 15$$

$$PV = 2,000 \times [(1 - (1 + 0.05)^{-15}) / 0.05]$$

$$PV = 2,000 \times [(1 - 1 / (1.05)^{15}) / 0.05]$$

$$\text{Calculate } (1.05)^{15} \approx 2.0789$$

$$\text{So, } PV \approx 2,000 \times [(1 - 1 / 2.0789) / 0.05]$$

$$\approx 2,000 \times [(1 - 0.481) / 0.05]$$

$$\approx 2,000 \times [0.519 / 0.05]$$

$$\approx 2,000 \times 10.38 \approx \$20,760$$

Answer:

The present value of saving \$2,000 annually for 15 years at 5% interest is approximately \$20,760.

Time Value of Money Practice Problems: An In-Depth Analytical Review

The time value of money practice problems serve as a fundamental educational and applied tool in finance, accounting, economics, and investment management. Understanding and solving these problems enable students, practitioners, and investors to quantify the value of money across

different time periods, a concept that underpins virtually every financial decision. This article offers an extensive exploration into the significance of these practice problems, their core principles, methodologies, common pitfalls, and their practical applications in real-world scenarios.

Introduction to the Time Value of Money

The concept of the time value of money (TVM) is rooted in the fundamental financial principle that a sum of money available today is worth more than the same sum in the future due to its potential earning capacity. This core idea underpins the valuation of investments, loans, annuities, and other financial instruments.

Key reasons for the time value of money include:

- Opportunity Cost: The potential returns that could be earned if the money were invested elsewhere.
- Inflation: The decrease in purchasing power over time, which diminishes the real value of future money.
- Risk and Uncertainty: Future cash flows are subject to risks, making present money more valuable.

Practicing problems centered on TVM help students and professionals internalize these principles, develop proficiency with calculation tools, and understand how different variables influence financial decisions.

Core Concepts and Formulas in Practice Problems

Time value of money practice problems typically involve the application of a set of foundational formulas, which can be categorized into present value (PV), future value (FV), annuities, and perpetuities. Mastery of these formulas is essential for solving a wide array of problems.

Future Value (FV)

The future value formula determines how much a present sum will grow over a specified period at a given interest rate:

$$[FV = PV \times (1 + r)^n]$$

Where:

- (PV) = Present Value
- (r) = interest rate per period
- (n) = number of periods

Present Value (PV)

The present value formula discounts a future sum to its current worth:

$$PV = \frac{FV}{(1 + r)^n}$$

Annuities and Ordinary Annuities

Annuities involve a series of equal payments over regular intervals. The formulas for the present value and future value of annuities incorporate the annuity factor:

- Present Value of an Ordinary Annuity:

$$PV_{\text{annuity}} = P \times \left(\frac{1 - (1 + r)^{-n}}{r} \right)$$

- Future Value of an Ordinary Annuity:

$$FV_{\text{annuity}} = P \times \left(\frac{(1 + r)^n - 1}{r} \right)$$

Where:

- (P) = periodic payment
- (r) = interest rate per period
- (n) = number of periods

Perpetuities

Perpetuities are streams of indefinite payments, valued as:

$$PV = \frac{P}{r}$$

Application of Practice Problems in Education and Industry

Educational context: Practice problems serve as critical tools for students to develop and reinforce

their understanding of TVM concepts. They facilitate active learning through problem-solving, allowing students to apply formulas, interpret results, and recognize the influence of variables like interest rates and time horizons.

Industry context: Financial analysts, investment managers, and accountants regularly solve complex TVM problems to evaluate investment opportunities, price financial securities, determine loan payments, and conduct valuation analyses.

Common Types of Time Value of Money Practice Problems

Practitioners encounter a diverse array of problems, often categorized into the following types:

Simple Future and Present Value Problems

These involve calculating the future or present value of a lump sum or a single cash flow.

Ordinary and Annuity Calculations

Problems involving regular payments?such as mortgage payments or retirement savings?are common, requiring the use of annuity formulas.

Perpetuities and Growing Annuities

Valuing streams of payments that continue indefinitely or grow at a certain rate.

Loan Amortization and Payment Calculations

Determining periodic payments for loans, including principal and interest components.

Investment Appraisal and Valuation

Evaluating the worth of investments or projects by discounting expected cash flows.

Sample Practice Problems and Solutions

To illustrate, consider the following examples:

Problem 1:

Calculate the future value of \$5,000 invested today at an annual interest rate of 8% over 10 years.

Solution:

Using the FV formula:

$$[FV = 5000 \times (1 + 0.08)^{10}]$$

$$[FV = 5000 \times (1.08)^{10} \approx 5000 \times 2.1589 \approx \$10,794.50]$$

Problem 2:

What is the present value of receiving \$12,000 in 5 years if the discount rate is 6%?

Solution:

Using the PV formula:

$$[PV = \frac{12000}{(1 + 0.06)^5}]$$

$$[PV = \frac{12000}{(1.06)^5} \approx \frac{12000}{1.3382} \approx \$8,964.70]$$

Problem 3:

Calculate the present value of an ordinary annuity of \$1,000 paid annually for 8 years at a 5% interest rate.

Solution:

Using the PV of annuity formula:

$$[PV_{\text{annuity}} = 1000 \times \left(\frac{1 - (1 + 0.05)^{-8}}{0.05} \right)]$$

$$[PV_{\text{annuity}} = 1000 \times \left(\frac{1 - (1.05)^{-8}}{0.05} \right)]$$

Calculating:

$$[(1.05)^{-8} \approx 0.6768]$$

$$[PV_{\text{annuity}} = 1000 \times \left(\frac{1 - 0.6768}{0.05} \right) = 1000 \times \left(\frac{0.3232}{0.05} \right) \approx 1000 \times 6.464 \approx \$6,464]$$

Common Challenges and Mistakes in Practice Problems

While practice problems are invaluable, learners often encounter pitfalls:

- Misapplying formulas: Confusing present and future value formulas or mixing up annuities with perpetuities.
- Ignoring compounding frequency: Assuming annual compounding when semi-annual or quarterly compounding is applicable.
- Inconsistent time periods: Failing to match the period frequency in the rate, periods, and payments.
- Overlooking cash flow timing: Not accounting for whether payments are at the beginning or end of periods (annuity due vs. ordinary annuity).
- Rounding errors: Accumulating small inaccuracies that lead to incorrect conclusions.

Addressing these challenges requires careful attention to problem details and a thorough understanding of underlying concepts.

Practical Applications of Practice Problems in Financial Decision-Making

The mastery of time value of money practice problems directly influences real-world decision-making:

- Investment valuation: Determining the fair value of stocks, bonds, and other securities.
- Loan structuring: Calculating mortgage payments, car loans, and personal loans.
- Retirement planning: Estimating the amount needed to save periodically to reach retirement goals.
- Business valuation: Discounting projected cash flows to assess company worth.
- Capital budgeting: Evaluating the profitability of projects using net present value (NPV) analysis.

In each case, practice problems sharpen analytical skills and promote a quantitative understanding necessary for sound financial strategies.

Conclusion: The Significance of Practice in Mastering TVM

The time value of money practice problems are more than mere academic exercises—they are vital tools for cultivating financial literacy and decision-making acumen. Through repeated application of core formulas, students and professionals develop intuition for how variables interact and influence outcomes.

Furthermore, these problems serve as foundational stepping stones toward more complex financial

modeling, risk assessment, and strategic planning. As financial markets evolve and new instruments emerge, the ability to accurately solve TVM problems remains an indispensable skill.

In essence, mastering these practice problems transforms theoretical knowledge into practical expertise, empowering individuals and organizations to make informed, value-maximizing financial decisions.

QuestionAnswer What is the time value of money and why is it important in practice problems? The time value of money is the concept that a sum of money today is worth more than the same sum in the future due to its potential earning capacity. It is important in practice problems because it helps in evaluating investment opportunities, loan decisions, and savings plans by discounting future cash flows to their present value. How do you calculate the present value of a future sum in a time value of money problem? You calculate the present value by dividing the future sum by $(1 + \text{interest rate})$ raised to the power of the number of periods: $PV = FV / (1 + r)^n$, where PV is present value, FV is future value, r is the interest rate per period, and n is the number of periods. What is the difference between present value and future value in time value of money problems? Present value refers to the current worth of a future sum discounted at a specific interest rate, while future value is the amount the current sum will grow to after a certain period at a given interest rate. Essentially, PV discounts future cash flows to today, and FV projects current cash flows into the future. What role does the interest rate play in time value of money practice problems? The interest rate determines the rate at which money grows over time or is discounted back to the present. A higher interest rate increases the future value of an investment and decreases the present value of future cash flows, affecting the calculations in practice problems. Can you explain how to solve an annuity payment problem involving the time value of money? Yes, to solve an annuity payment problem, you use the annuity formula: $PMT = PV \times [r / (1 - (1 + r)^{-n})]$ for present value annuities, or rearranged formulas for future value annuities. Here, PMT is the periodic payment, r is the interest rate per period, n is the total number of payments, and PV is the present value of the annuity.

Common Engineering Economics Subject Code Questions with Answers

Question 1: Calculate the Present Worth of a Future Sum

Question:

A project promises to pay \$10,000 five years from now. If the discount rate is 8% per annum, what is

the present worth of this amount?

Answer:

The present worth (PW) can be calculated using the formula:

$$[PW = \frac{F}{(1 + i)^n}]$$

Where:

- (F) = Future sum = \$10,000
- (i) = Discount rate = 8% = 0.08
- (n) = Number of years = 5

Calculating:

$$[PW = \frac{10,000}{(1 + 0.08)^5} = \frac{10,000}{1.46933} \approx \$6,805.83]$$

Conclusion:

The present worth of \$10,000 received after five years at an 8% discount rate is approximately \$6,805.83.

Question 2: Determine the Future Value of an Investment

Question:

An engineer invests \$5,000 annually at an interest rate of 10% for 7 years. What will be the future value of this series of investments?

Answer:

This is a future value of an ordinary annuity problem. The formula is:

$$[FV = P \times \frac{(1 + i)^n - 1}{i}]$$

Where:

- (P) = Annual payment = \$5,000

- i = Interest rate = 10% = 0.10

- n = Number of years = 7

Calculating:

$$FV = 5,000 \times \frac{(1 + 0.10)^7 - 1}{0.10}$$

$$FV = 5,000 \times \frac{1.948717 - 1}{0.10}$$

$$FV = 5,000 \times 9.48717 \approx \$47,435.85$$

Conclusion:

After 7 years, the total future value of the investments will be approximately \$47,435.85.

Question 3: Find the Equivalent Annual Cost (EAC)

Question:

A machine costs \$50,000, has a salvage value of \$5,000 after 10 years, and requires annual maintenance costs of \$3,000. If the interest rate is 12%, what is the equivalent annual cost (EAC) of owning and operating the machine?

Answer:

The EAC is calculated by spreading the total costs over the lifespan of the machine, accounting for the time value of money.

Step 1: Calculate the Present Worth of the costs.

- Initial cost: \$50,000 (at year 0)

- Salvage value: \$5,000 after 10 years, so its present worth (PW salvage):

$$PW_{\text{salvage}} = \frac{5,000}{(1 + 0.12)^{10}} \approx \frac{5,000}{3.10585} \approx \$1,609.84$$

Step 2: Calculate the present worth of annual maintenance costs using the capital recovery factor:

$$PW_{\text{maintenance}} = 3,000 \times \frac{(1 + i)^n - 1}{i \times (1 + i)^n}$$

Alternatively, since maintenance costs are annual, the present worth of an annuity:

$$PW_{\text{maintenance}} = 3,000 \times \frac{1 - (1 + i)^{-n}}{i}$$

Calculating:

$$PW_{\text{maintenance}} = 3,000 \times \frac{1 - (1 + 0.12)^{-10}}{0.12}$$

$$PW_{\text{maintenance}} = 3,000 \times \frac{1 - 0.32197}{0.12}$$

$$PW_{\text{maintenance}} = 3,000 \times 5.650 \approx \$16,950$$

Step 3: Calculate the net present worth (NPW):

$$NPW = (\text{Initial cost}) - PW_{\text{salvage}} + PW_{\text{maintenance}}$$

$$NPW = 50,000 - 1,609.84 + 16,950 \approx \$65,340.16$$

Step 4: Find the EAC:

$$EAC = NPW \times \frac{i \times (1 + i)^n}{(1 + i)^n - 1}$$

$$EAC = 65,340.16 \times \frac{0.12 \times (1.12)^{10}}{(1.12)^{10} - 1}$$

$$EAC = 65,340.16 \times \frac{0.12 \times 3.10585}{3.10585 - 1}$$

$$EAC = 65,340.16 \times \frac{0.3727}{2.10585} \approx 65,340.16 \times 0.177 \approx \$11,565.45$$

Conclusion:

The equivalent annual cost of owning and operating the machine is approximately \$11,565.45.

Question 4: Calculate the Internal Rate of Return (IRR)

Question:

An investment of \$20,000 yields cash inflows of \$5,000 annually for 6 years. What is the internal rate of return (IRR)?

Answer:

IRR is the discount rate that makes the net present value (NPV) zero. The formula involves solving:

$$\left[20,000 = 5,000 \times \frac{1 - (1 + \text{IRR})^{-6}}{\text{IRR}} \right]$$

This equation is typically solved iteratively or using financial calculator or software. Using approximation:

Step 1: Recognize that this is the present value of an annuity:

$$\left[PV = P \times \frac{1 - (1 + r)^{-n}}{r} \right]$$

Step 2: Rearrange to estimate IRR:

$$\left[\text{NPV} = 0 \rightarrow PV = 20,000 \right]$$

$$\left[20,000 = 5,000 \times \frac{1 - (1 + r)^{-6}}{r} \right]$$

Dividing both sides by 5,000:

$$\left[4 = \frac{1 - (1 + r)^{-6}}{r} \right]$$

Now, test different rates:

- At $(r = 10\%)$:

$$\left[\frac{1 - (1 + 0.10)^{-6}}{0.10} = \frac{1 - 0.5645}{0.10} = 4.355 \right] \text{ (greater than 4)}$$

- At $(r = 12\%)$:

$$\left[\frac{1 - (1 + 0.12)^{-6}}{0.12} = \frac{1 - 0.507}{0.12} = 4.104 \right] \text{ (close to 4)}$$

Since 4.104 is slightly above 4, IRR is approximately 11.5%.

Conclusion:

The internal rate of return (IRR) for this investment is approximately 11.5%.

Question 5: Determine the Payback Period

Question:

A project requires an initial investment of \$100,000 and is expected to generate annual cash inflows of \$25,000. What is the payback period?

Answer:

The payback period is the time needed to recover the initial investment from cash inflows. It is calculated as:

$$\text{Payback Period} = \frac{\text{Initial Investment}}{\text{Annual Cash Inflows}}$$

Calculating:

$$\frac{100,000}{25,000} = 4 \text{ years}$$

Conclusion:

The project will recover its initial investment in

It involves analyzing costs, benefits, risks, and economic viability of projects, often through subject code questions that simulate real-world scenarios. Proficiency in tackling these questions ensures that engineers can make informed choices about project investments, resource allocation, and cost management.

Key Components of Engineering Economics Subject Code Questions

Before diving into solving techniques, it's vital to understand the typical components of these questions:

- Cost Estimation: Identifying and calculating various costs involved in a project (initial, operational, maintenance).
- Time Value of Money: Applying concepts like present value (PV), future value (FV), and discount rates.
- Financial Metrics: Calculating and interpreting measures such as net present value (NPV), internal rate of return (IRR), payback period, and benefit-cost ratio.
- Comparison of Alternatives: Evaluating different project options based on economic criteria.
- Sensitivity Analysis: Assessing how changes in assumptions or variables impact outcomes.

Step-by-Step Approach to Answering Engineering Economics Subject Code Questions

- Carefully Read and Understand the Question

Start by identifying what is being asked:

- Are you asked to calculate the NPV or IRR?
- Is the question about comparing alternatives?
- Does it involve determining the most economical choice?

Note all given data: costs, revenues, interest rates, project durations, etc.

- Organize Data Systematically

Create a table or list to organize cash flows, costs, and assumptions. Clear organization helps avoid errors during calculations.

- Identify the Appropriate Financial Tools

Choose the right method based on the question:

- Use NPV for evaluating the profitability of a project over time.
- Use IRR when comparing the rate of return of different projects.
- Use Payback Period for quick assessment of recovery time.
- Use Benefit-Cost Ratio (BCR) for comparing multiple alternatives.

- Apply Relevant Formulas and Techniques

Ensure you understand and correctly apply formulas, such as:

- Present Value (PV):

$$PV = \text{Future Value} / (1 + i)^n$$

- Net Present Value (NPV):

$$NPV = ? (\text{Cash inflow/outflow at time } t) / (1 + i)^t$$

- Internal Rate of Return (IRR):

The discount rate (i) at which $NPV = 0$

- Payback Period:

Time taken for cumulative cash flows to recover initial investment

- Perform Calculations Carefully

Use scientific calculators or spreadsheets like Excel to handle complex computations, especially for iterative methods like IRR.

- Analyze and Interpret Results

Compare the computed metrics:

- A positive NPV indicates a potentially profitable project.
- The IRR should be higher than the required rate of return.
- Shorter payback periods are generally preferred, but consider the project's overall profitability.

- Cross-Verify and Validate Answers

Double-check calculations. Confirm that assumptions align with the question's context.

Practical Examples of Engineering Economics Subject Code Questions with Answer

Example 1: Net Present Value Calculation

Question:

A company is considering purchasing a new machine costing \$50,000. The machine is expected to generate additional cash inflows of \$15,000 annually for 5 years. The company's required rate of return is 10%. Should the company invest in the machine?

Solution:

Step 1:

Identify data:

- Initial Investment = \$50,000
- Annual Cash Inflows = \$15,000
- Duration = 5 years
- Discount Rate = 10%

Step 2:

Calculate Present Value of inflows using PV of annuity:

$$\text{PV of inflows} = \$15,000 \times [(1 - (1 + i)^{-n}) / i]$$

$$\text{PV of inflows} = \$15,000 \times [(1 - (1 + 0.10)^{-5}) / 0.10]$$

$$\text{PV of inflows} = \$15,000 \times [1 - (1 / (1.6105))] / 0.10$$

$$\text{PV of inflows} = \$15,000 \times [1 - 0.6209] / 0.10$$

$$\text{PV of inflows} = \$15,000 \times 0.3791 / 0.10$$

$$\text{PV of inflows} = \$15,000 \times 3.791$$

PV of inflows ? \$56,865

Step 3:

Calculate NPV:

NPV = PV of inflows - Initial Investment

NPV = \$56,865 - \$50,000 = \$6,865

Conclusion:

Since NPV is positive (\$6,865), the investment is financially viable.

Example 2: Internal Rate of Return (IRR)

Question:

A project requires an initial investment of \$100,000 and is expected to generate cash inflows of \$30,000 annually for 4 years. What is the IRR? Should the project be accepted if the required rate of return is 12%?

Solution:

Step 1:

Set NPV equation to zero and solve for IRR:

$$0 = -\$100,000 + \$30,000 \times [(1 - (1 + \text{IRR})^{-4}) / \text{IRR}]$$

Step 2:

Estimate IRR using trial and error or financial calculator:

Using Excel IRR function or calculator:

Cash flows: Year 0: -\$100,000

Year 1-4: \$30,000

IRR ? 17.4%

Step 3:

Decision:

Since IRR (17.4%) > required rate (12%), the project is acceptable.

Practical Example: Investment Decision Using Present Worth Method

To illustrate the application of solution exercises, consider a practical scenario:

Problem Statement:

A company is considering two alternative projects, A and B. Project A requires an initial investment of \$100,000 and is expected to generate cash inflows of \$30,000 annually for 5 years. Project B requires an initial investment of \$150,000 with annual cash inflows of \$40,000 for 5 years. The company's required rate of return is 8%. Which project should the company select based on present worth analysis?

Solution Steps:

- Identify Data:

- Investment A: \$100,000
- Annual cash inflow A: \$30,000
- Investment B: \$150,000
- Annual cash inflow B: \$40,000
- Duration: 5 years
- Discount rate: 8%

- Calculate Present Worth of Cash Inflows:

- Use Present Worth of Annuity formula:

$$P = A \times \frac{1 - (1 + i)^{-n}}{i}$$

$$P = A \times \frac{1 - (1 + i)^{-n}}{i}$$

$$P_A = 30,000 \times \frac{1 - (1 + 0.08)^{-5}}{0.08}$$

- Compute for Project A:

$$P_A = 30,000 \times \frac{1 - (1 + 0.08)^{-5}}{0.08}$$

$$P_A = 30,000 \times \frac{1 - (1 + 0.08)^{-5}}{0.08}$$

$$(1 + 0.08)^{-5} \approx 0.6806$$

- Calculate:

$$(1 + 0.08)^{-5} \approx 0.6806$$

$$(1 + 0.08)^{-5} \approx 0.6806$$

\]

- So:

\[

$$P_A = 30,000 \times \frac{1 - 0.6806}{0.08} = 30,000 \times \frac{0.3194}{0.08} \approx 30,000 \times 3.9925 \approx 119,775$$

\]

- Calculate for Project B:

- \[

$$P_B = 40,000 \times \frac{1 - (1 + 0.08)^{-5}}{0.08} \approx 40,000 \times 3.9925 \approx 159,700$$

\]

- Determine Net Present Value (NPV):

- Project A:

\[

$$NPV_A = P_A - \text{Initial Investment} = 119,775 - 100,000 = 19,775$$

\]

- Project B:

\[

$$NPV_B = 159,700 - 150,000 = 9,700$$

\]

- Decision:
- Since both projects have positive NPVs, they are financially feasible.
- Project A has a higher NPV, thus the company should prefer Project A based on this analysis.

Key Takeaways:

- Present worth analysis provides a clear comparison of alternative investments.
- Proper understanding of formulas and careful calculation are crucial.
- Sensitivity analysis can further refine decision-making.
