Fundamental Concepts in Hydrology

Understanding basic hydrological concepts is key to grasping more complex phenomena and models. Below are some of the core principles.

The Water Cycle

The water cycle, also known as the hydrological cycle, describes the continuous movement of water within the Earth's atmosphere, land, and oceans. It involves various processes:

- Evaporation: Water turns into vapor from surfaces like oceans, lakes, and soils
- Transpiration: Release of water vapor from plants
- Condensation: Water vapor cools and forms clouds
- Precipitation: Water falls back to the Earth's surface as rain, snow, sleet, or hail
- Infiltration: Water seeps into the ground, replenishing groundwater
- Runoff: Excess water flows over the land surface towards rivers and oceans

Hydrological Cycle Components

The main components include:

- Surface Water: Water in rivers, lakes, and reservoirs
- Groundwater: Water stored underground in aquifers

- Units: Millimeters (mm) or inches

Streamflow and Discharge

- Discharge: Volume of water flowing through a river cross-section per unit time (m^3/s)
- Measurement tools: Flow meters, current meters, weirs, flumes
- Importance: Essential for flood forecasting and water resource management

Evapotranspiration

- The combined process of evaporation and plant transpiration
- Measured using lysimeters, eddy covariance systems, or estimated through models

Sample Questions and How to Approach Them

Question 1: Define the Hydrological Cycle and explain its components.

Approach:

Begin with a clear definition emphasizing the continuous movement of water within the Earth's system. List and describe components such as evaporation, condensation, precipitation, infiltration, runoff, and transpiration. Use diagrams if possible to illustrate the cycle.

Question 2: Calculate the peak runoff using the Rational Method for a given catchment.

Given Data:

- Area of catchment: 10 km²
- Rainfall intensity: 50 mm/hr
- Runoff coefficient: 0.3

Solution:

Use the Rational Formula:

$$Q = CiA$$

Where:

Q = Peak runoff (m³/sec)

C = runoff coefficient

i = rainfall intensity (m/sec)

A = area (m^2)

Convert units appropriately and perform calculations step-by-step.

Question 3: Interpret a hydrograph showing streamflow over a storm event.

Approach:

Identify key features such as time to peak, lag time, base flow, and storm duration. Discuss what these features reveal about the watershed characteristics and response time.
