Multiple-Choice Sample Question

Which of the following is NOT a function of the liver?

- a) Detoxification of harmful substances
- b) Production of insulin
- c) Storage of glycogen
- d) Production of bile

Answer: b) Production of insulin

Structured Question Sample

Question: Describe the process of photosynthesis. Include the raw materials involved and the products formed.

Answer:

Photosynthesis is the process by which green plants convert light energy into chemical energy stored in glucose. It occurs mainly in the chloroplasts of plant cells. The process involves two main stages: the light-dependent reactions and the light-independent reactions (Calvin cycle).

Raw materials involved:

- Carbon dioxide (CO_2) from the atmosphere
- Water (H_2O) absorbed by roots
- Light energy from the sun

Products formed:

- Glucose ($\text{C}_6\text{H}_{12}\text{O}_6$), a form of chemical energy
- Oxygen (O_2), released into the atmosphere

Brief explanation:

During photosynthesis, chlorophyll absorbs light energy, which drives the conversion of carbon dioxide and water into glucose and oxygen. The overall simplified equation is:

Data Interpretation Question

The table below shows the heart rates of a student at rest and after exercise.

| Condition | Heart Rate (beats per minute) |

|-----|-----|

| Resting | 70 |

| After Exercise | 130 |

Explain why the heart rate increases after exercise.

Answer:

The heart rate increases after exercise to supply more oxygen and nutrients to the muscles and to remove waste products like carbon dioxide more efficiently. During physical activity, muscles require more energy, which leads to an elevated demand for oxygen. The heart compensates by beating faster to circulate blood more rapidly, ensuring the body's metabolic needs are met during strenuous activity.
