Sample Questions and Their Corresponding Answers

Below are examples of typical questions from the Post Test 1 and their detailed answers. These serve as a model for understanding the question types and the reasoning process behind correct responses.

Question 1: Atomic Structure

Which particle determines the atomic number of an element?

Answer:

The proton determines the atomic number of an element. It is the number of protons in the nucleus that uniquely identifies an element.

Question 2: Periodic Trends

As you move across a period in the periodic table, what happens to the atomic radius?

Answer:

The atomic radius decreases across a period. This is because additional protons increase the nuclear charge, pulling electrons closer to the nucleus.

Question 3: Chemical Bonding

What type of bond is formed when a metal reacts with a nonmetal?

Answer:

An ionic bond is formed between a metal and a nonmetal. Metals tend to lose electrons, forming cations, while nonmetals gain electrons, forming anions, resulting in electrostatic attraction.

Question 4: Balancing Chemical Equations

Balance the following chemical equation:

Answer:

Balanced by ensuring the same number of each atom on both sides.

Question 5: Gas Laws

If the pressure of a gas increases while the temperature remains constant, what happens to the volume?

Answer:

The volume decreases. According to Boyle's Law, pressure and volume are inversely proportional at constant temperature.
